

# Discovery at a glance

## Global Reach, Local Knowledge Day and Night

### What makes this product different!

It provides network monitoring of IP devices but unlike a lot of monitoring products it also provides connection management, by linking the device to the switch and the port on the switch.

This allows you to understand where in the office the device is physically located by simply tracing the patch link from the switch.

It uses SNMP and DNS and ARP to discover information about the status of each device.

Polls can be scheduled by device, device type or all devices to ensure that the information is up to date.

Unlike a lot of devices which take a lot of work to configure and maintain. This product is simple: to configure you provide a CSV listing of your addresses to which populates Discovery, the system will do the rest.

Moves and changes are all highlighted in the log and everything is logged. The logs can be filtered to provide the view needed or there are custom filters for moves, changes and devices which have not responded to a poll.

Every view has an export to CSV option allowing you to take the information into other management applications.

Security is extremely important and the product has multiple levels of security built in.

A Customer forum and customer portal is available providing, documentation, downloads, general information as well as an area to communicate with other customers and colleagues.

It is a 100th of the price of other systems available. At under a £1,000 for the USB version and under £5,000 for the appliance.

Most products do patch management and discovery, connection management we believe is unique and more importantly the way that device management should be resolved.

The appliance can scale to enterprise levels and for global organisations, regional appliances can report back into a global hub providing full visibility of the organisations IP based assets.

Support and maintenance is by telephone, email, Skype

Upgrades are provided in a simple easy to load file.

Browse to where you put the file and select save.

Backup and restores are simply point and click.

Browser based so the product can be accessed from anywhere.

Developed and Tested at a number of large institutions so we know it scales. Once development testing has been completed the system is volume tested on large sites prior to release.

Dashboard by device type, providing a record of exactly how many of each device is on the network.

Flexibility built in with pre set searches or full Google style search function on every page.
